

DEMOGRAPHY AND MIGRATION : A COMPLICATED AFFAIR

Thomas Buettner
Berlin, Germany

Demography and migration

- Demography works best with models closed to the outside.
- If the analysis or projection is to include migration, the analysis is opened for other countries, potentially the whole world.
- If certain assumptions are made about migration in a particular country, other countries (the world) is also affected.
- It's the interaction, stupid!
- Balancing the world (later).

Scandal of invisibility

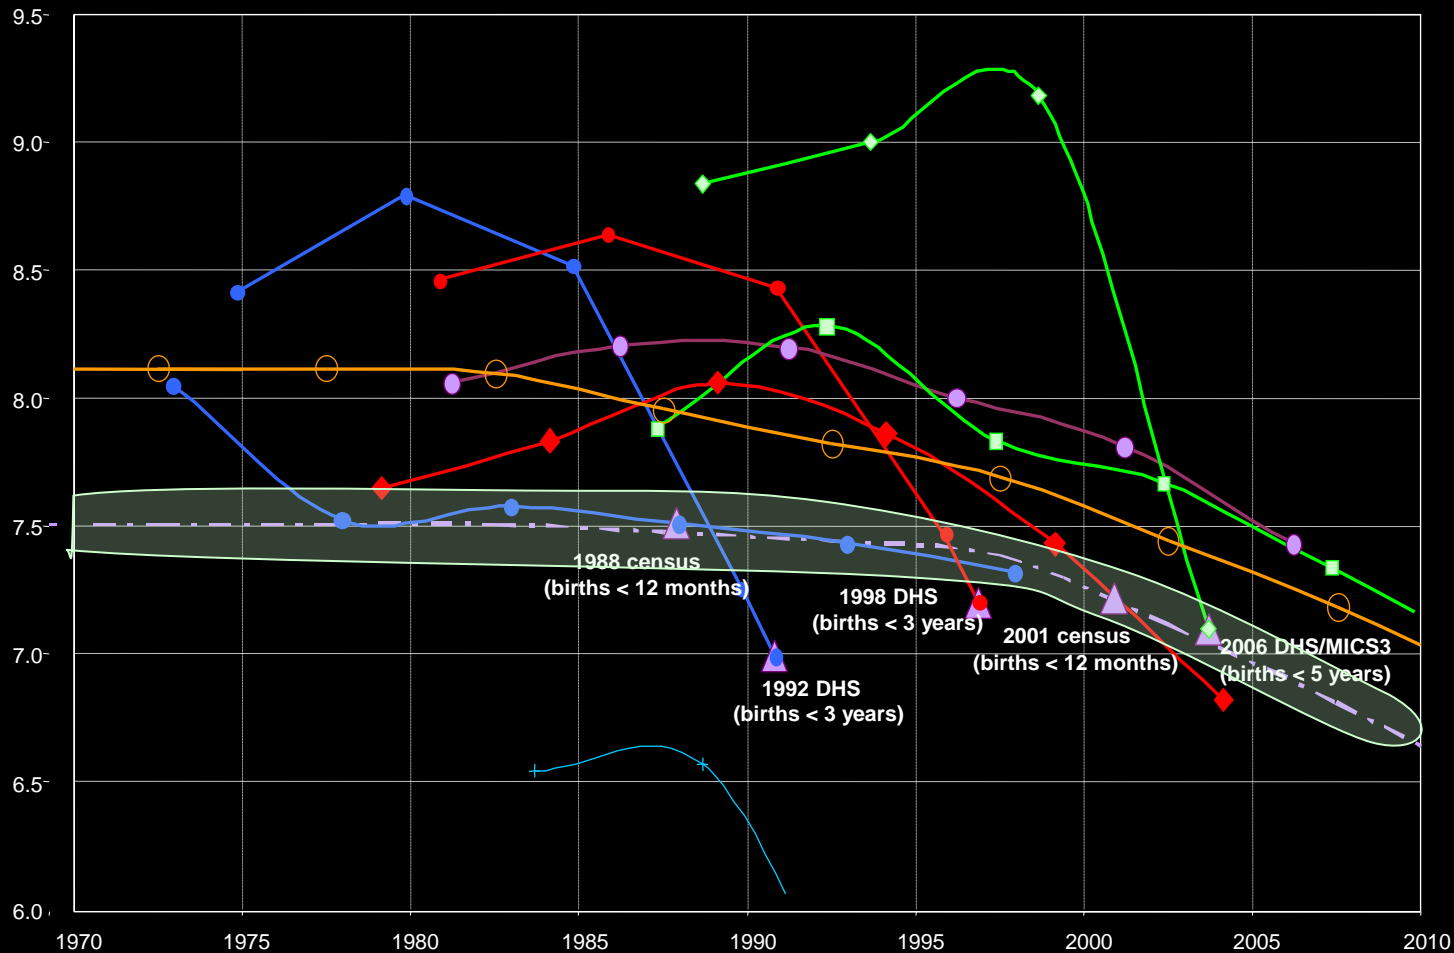

- ~50% of the world's adult population is not present in mortality statistics.
- Most developing country do not have a comprehensive and robust civil registration system.
- Those who are not counted do not count: Scandal of invisibility*
- The Lancet article does not mention migration!

*Setel et al (2007). A scandal of invisibility: making everyone count by counting everyone. The Lancet, Volume 370, Issue 9598, Pages 1569 - 1577, 3 November 2007

Data sources (TFR Niger)

Estimating the past: Naive attempt

Estimating the past: Best estimate

Demography and migration

- When data on migration flows are not available or incomplete, then migration estimates are produced by applying the balance equation of demography:

$$P_1 = P_0 + B - D + I - E$$

$$P_1 = P_0 + NC + NM$$

$$NM = P_1 - P_0 - NC$$

- Migration estimates often containing the error of closure of the general balancing equation:

$$P_1 = P_0 + NC + NM + \varepsilon$$

$$P_1 = P_0 + NC + [NM + \varepsilon]$$

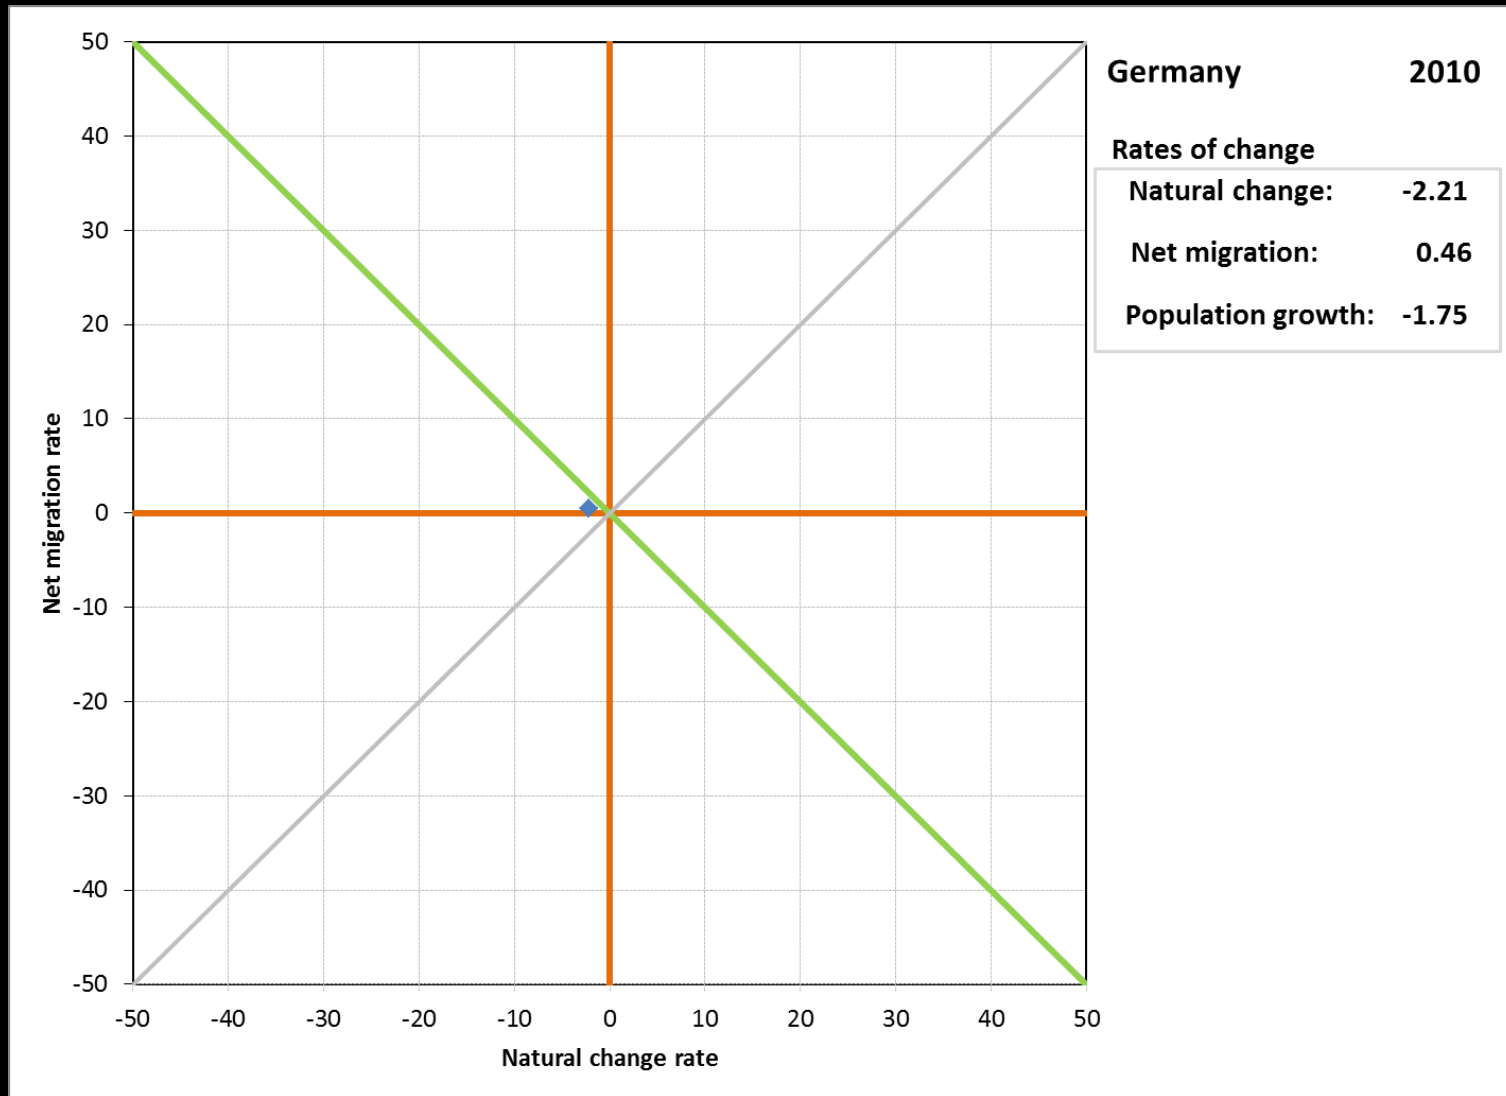

Demography and migration

- In order to create a consistent set of past estimates, net migration is often combined with the error that cannot be allocated elsewhere.

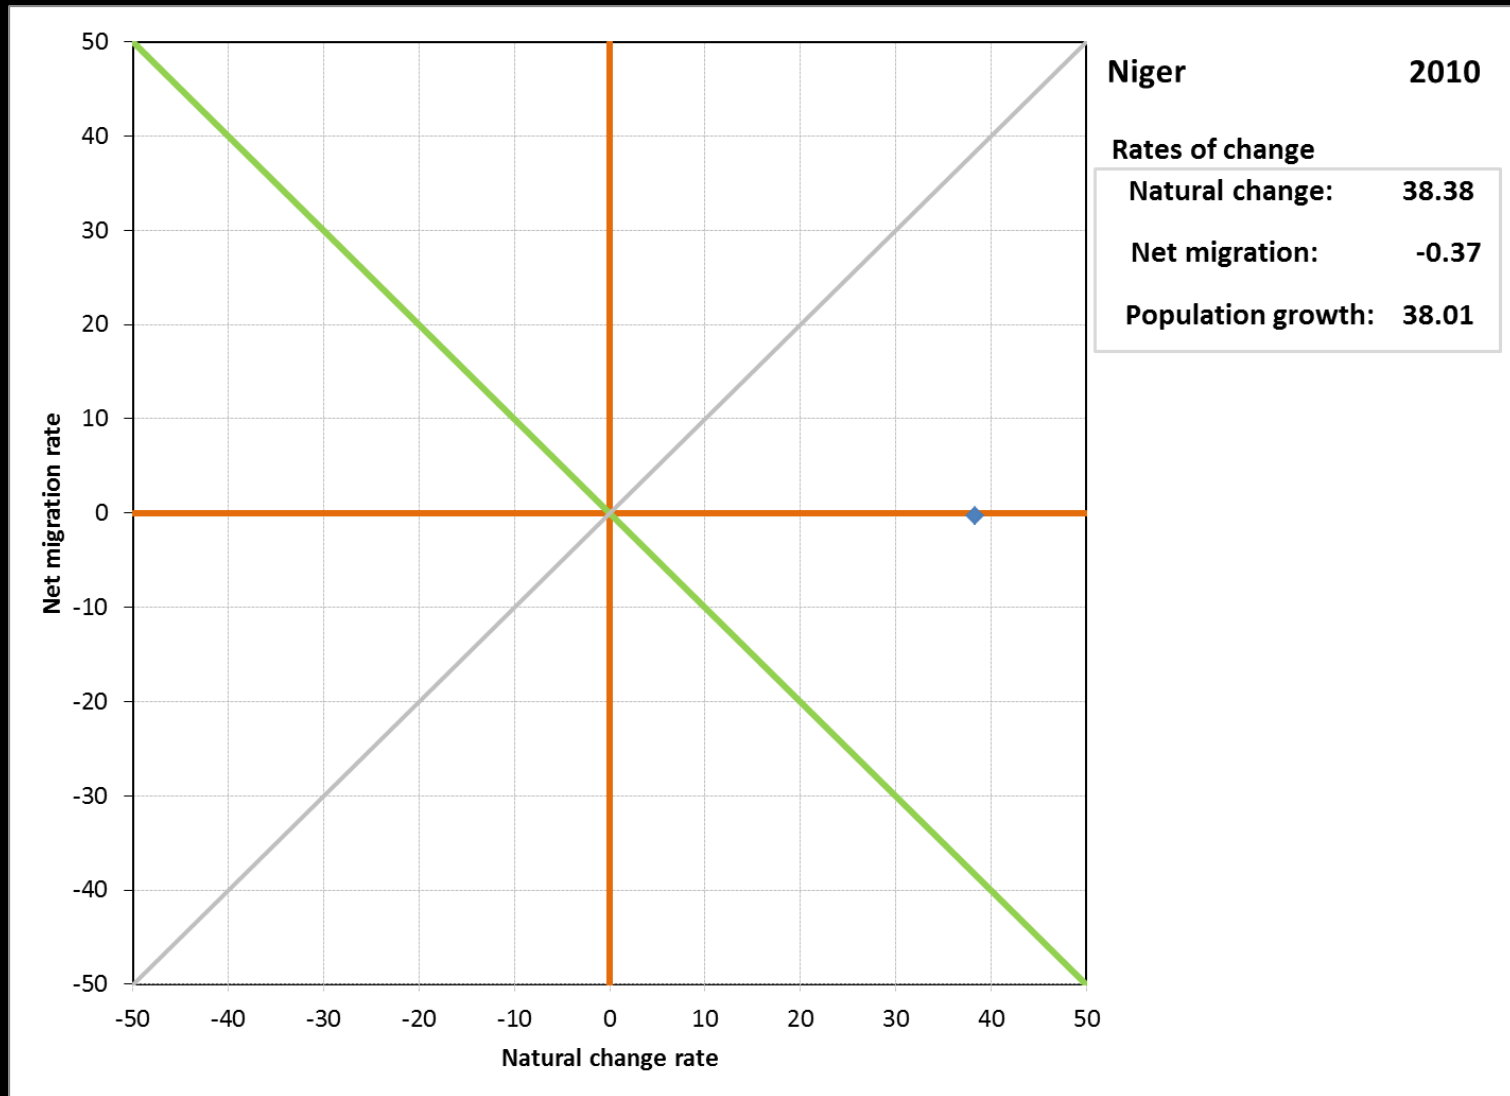

How important is international migration?

- Contribution of migration to population change by comparing the rates of natural change and the net migration rates
- If both rates are positive, they both contribute to population growth
- If both rates are negative, they both contribute to population decline
- If the two rates have different signs, they may reduce growth or reduce decline.

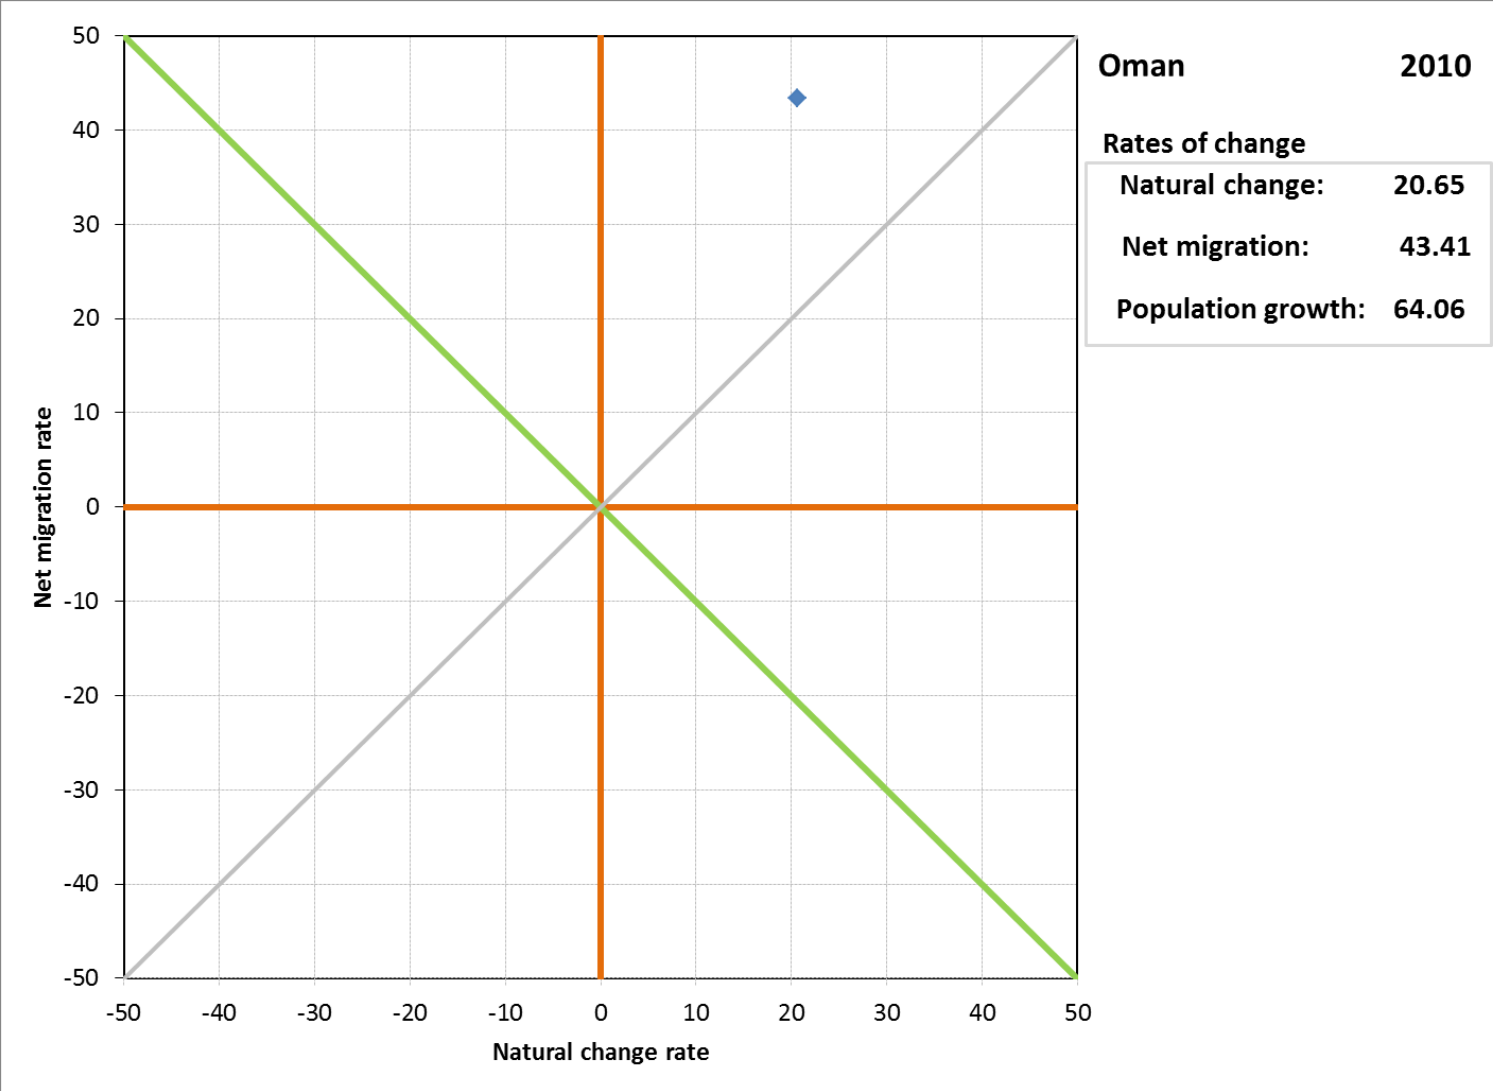

Components of change: Slowing decline

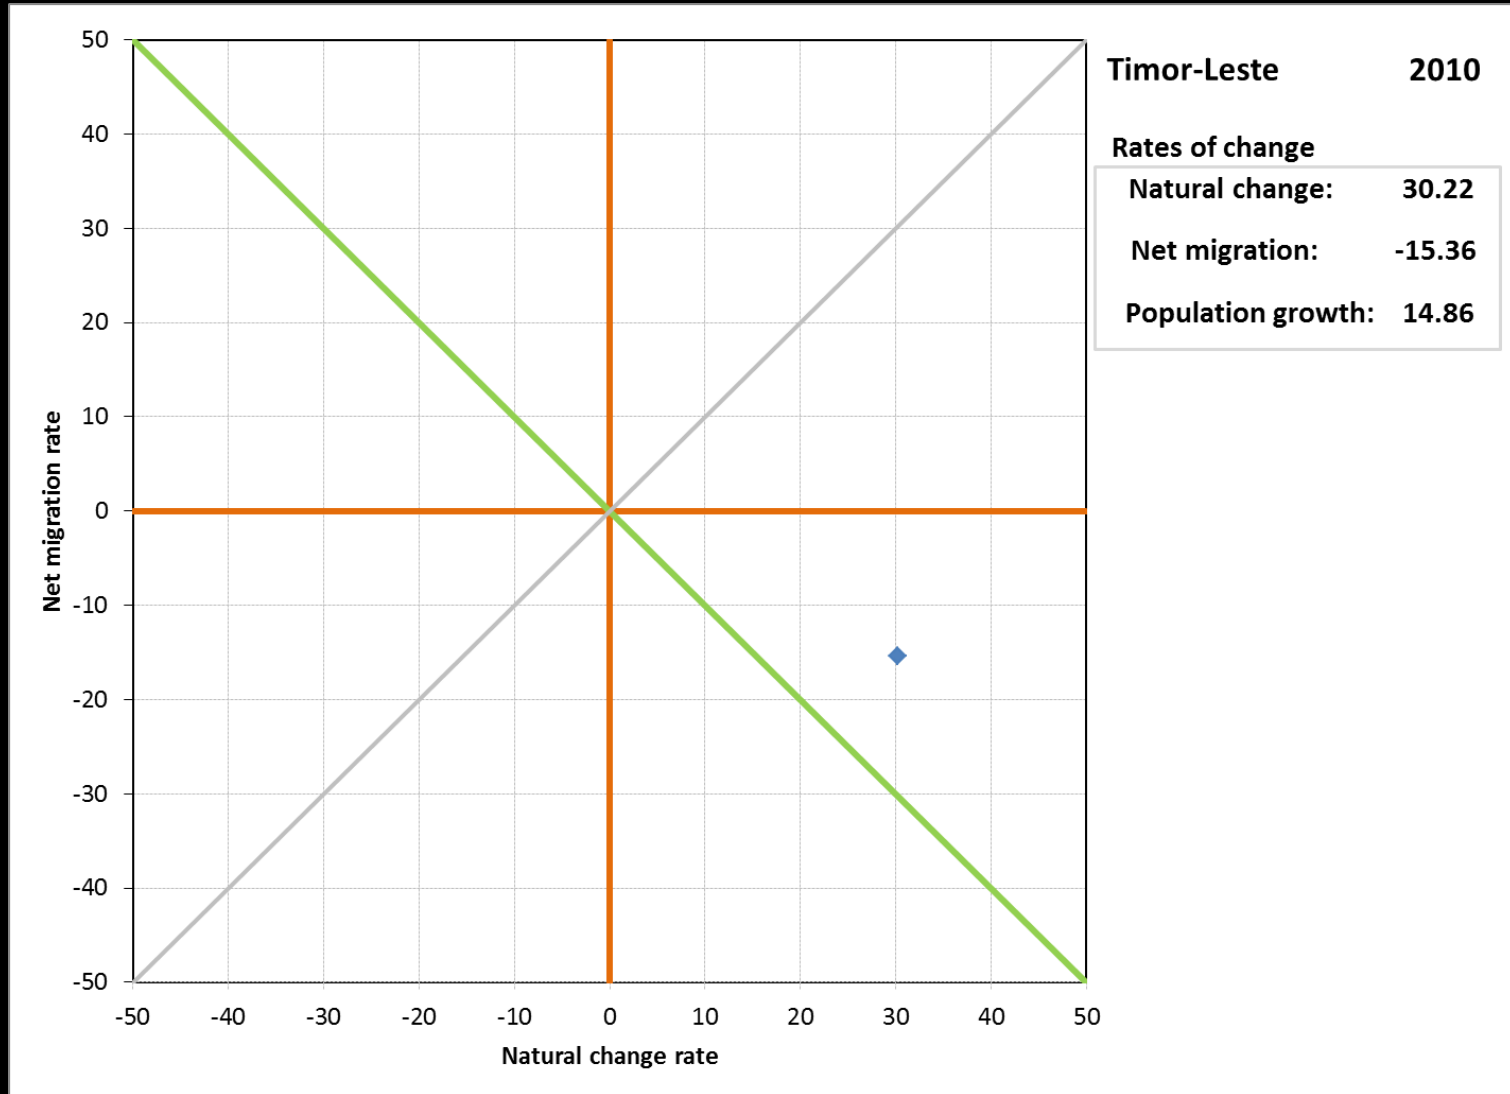

Components of change: No impact

Components of change: Adding to growth

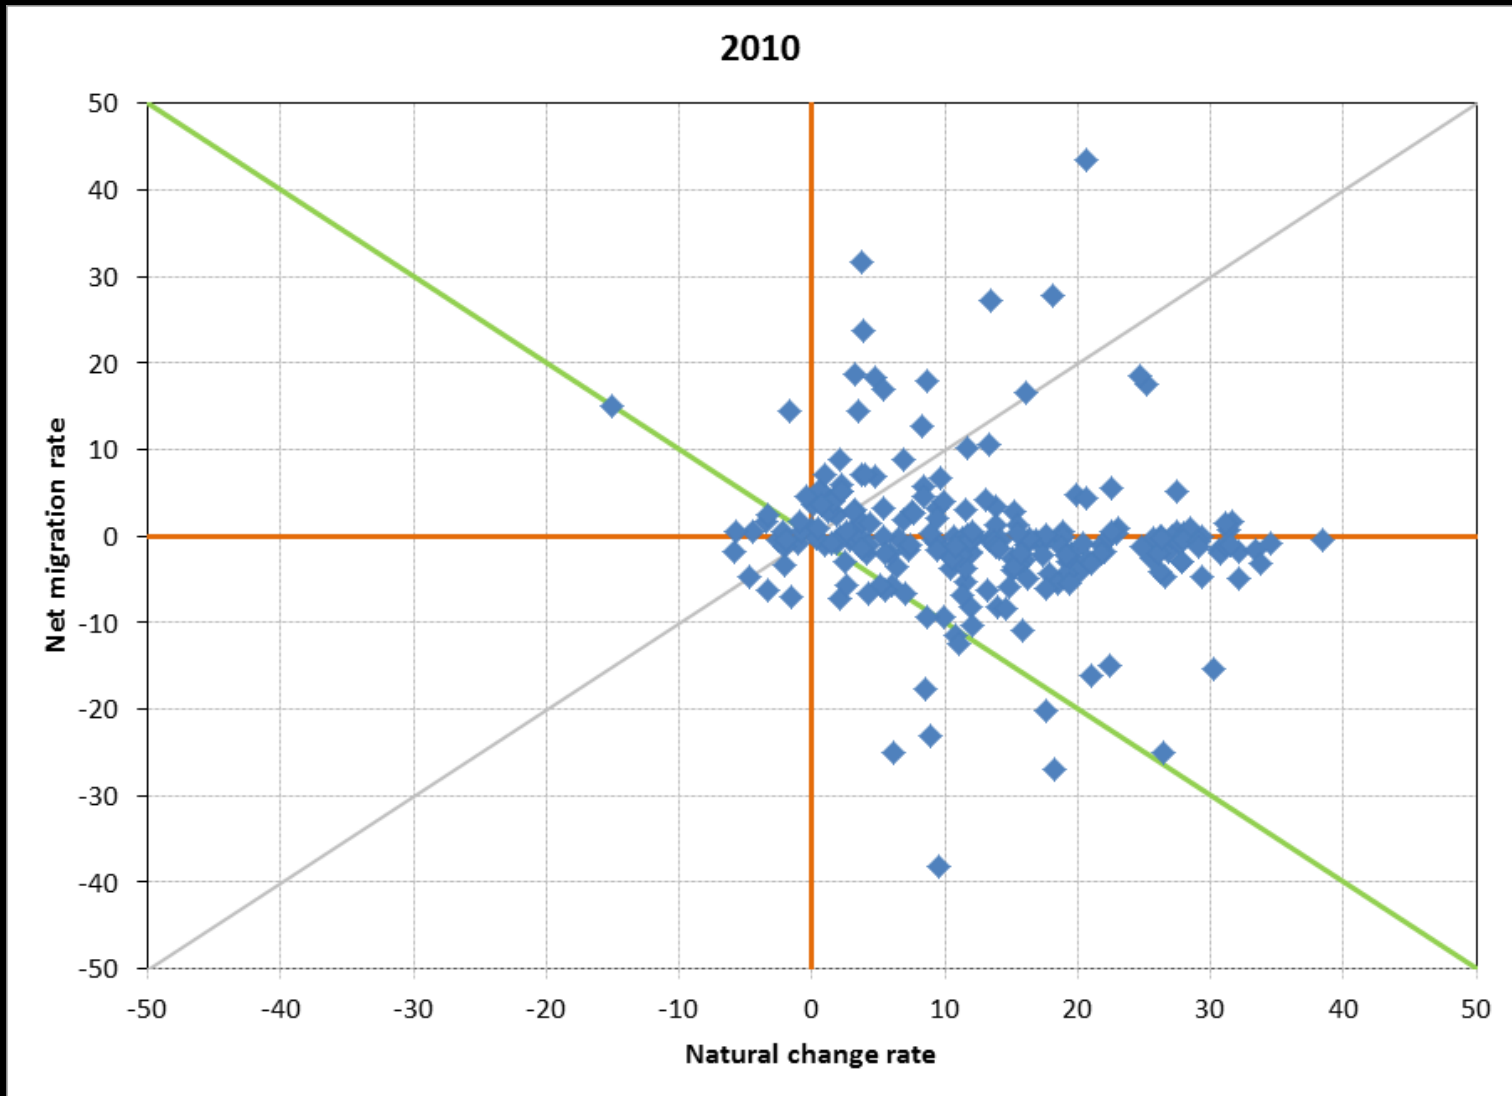

Components of change: Slowing growth

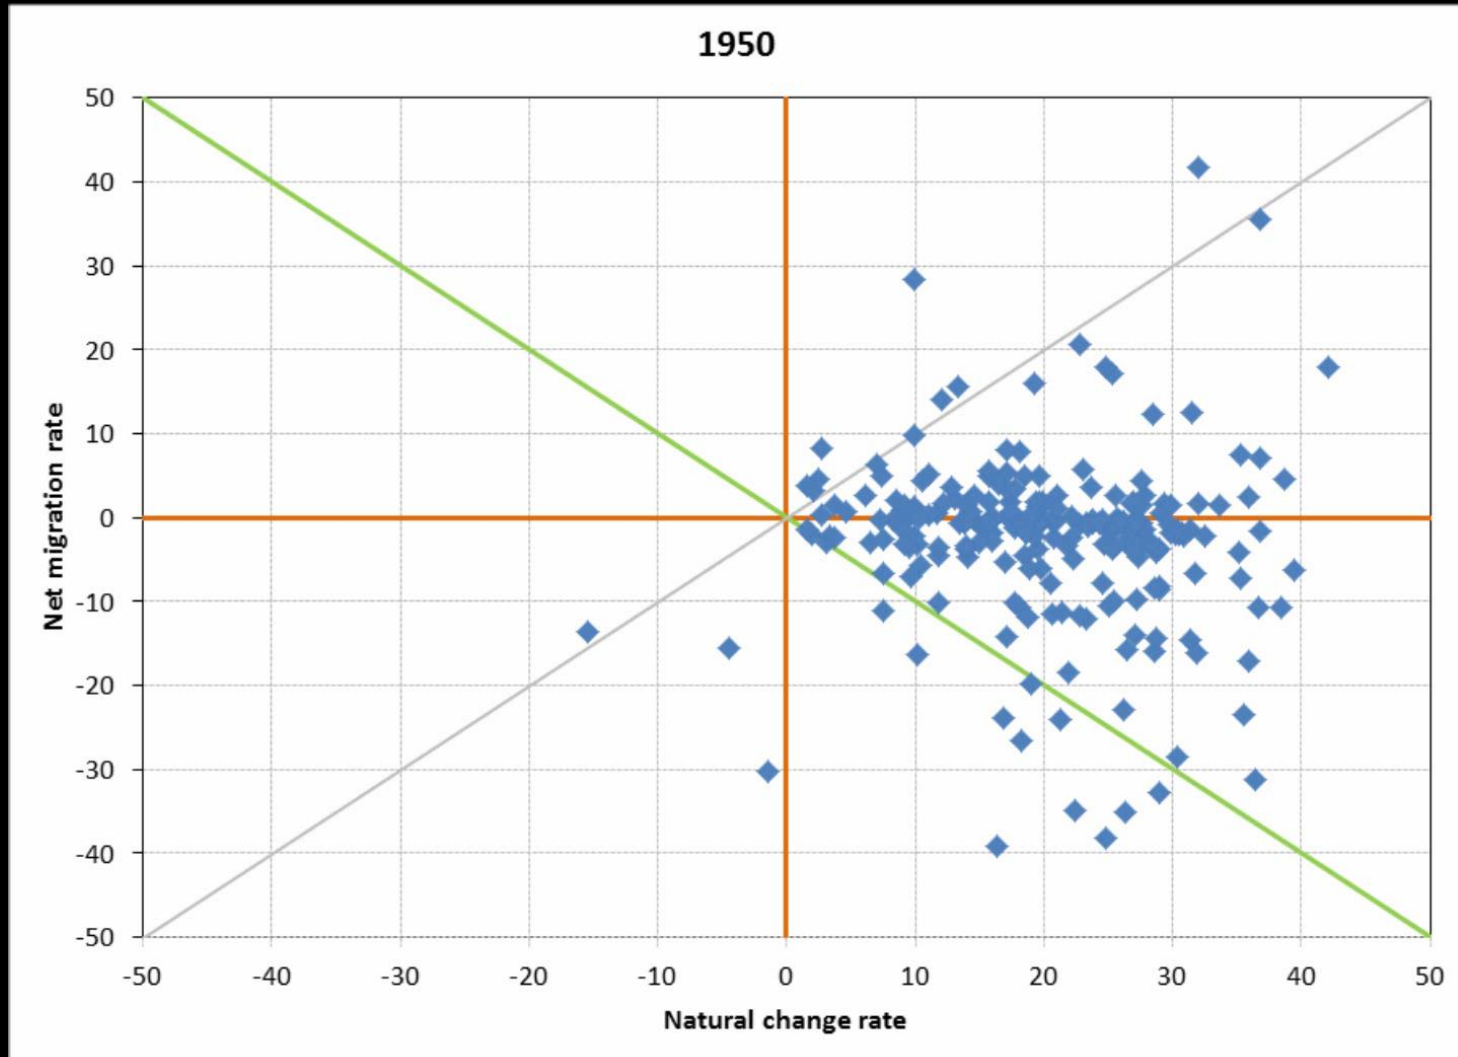

Components of change: Accelerating decline

Components of change 2010

Components of change, animated

Major trends according to estimates

- Examining current net migration estimates and projections from the three major providers gives a picture complex picture.
- The ranking of countries by net migration for 2005-2009 is not identical
- In some cases, even the signs are different

Ten countries with largest net out- and in-migration 2005-2009, by source

Rank	Country	UN/WPP	Rank	Country	US/IPC
1	Bangladesh	-3,638,955	1	Bangladesh	-2,834,143

The impact of migration in the future

- What is the contribution of international migration to population change?
- Migration-caused gains and losses by comparing the main projection variant to a hypothetical scenario provided by WPP (UN POP), assuming zero net migration starting in 2010

Migration-caused population gains/losses (compared to zero migration projections)

Discussion

- One of the most controversial and sensitive events affecting population change is statistically the least available (in terms of completeness, continuity and specificity).
- With the data on migration sparse, incomplete or ill-defined, and the actual trends often erratic, it seems impossible to generate suitable forecasting models for the dominant trends.
- The other demographic components are so much better behaved!

From high to low fertility and mortality

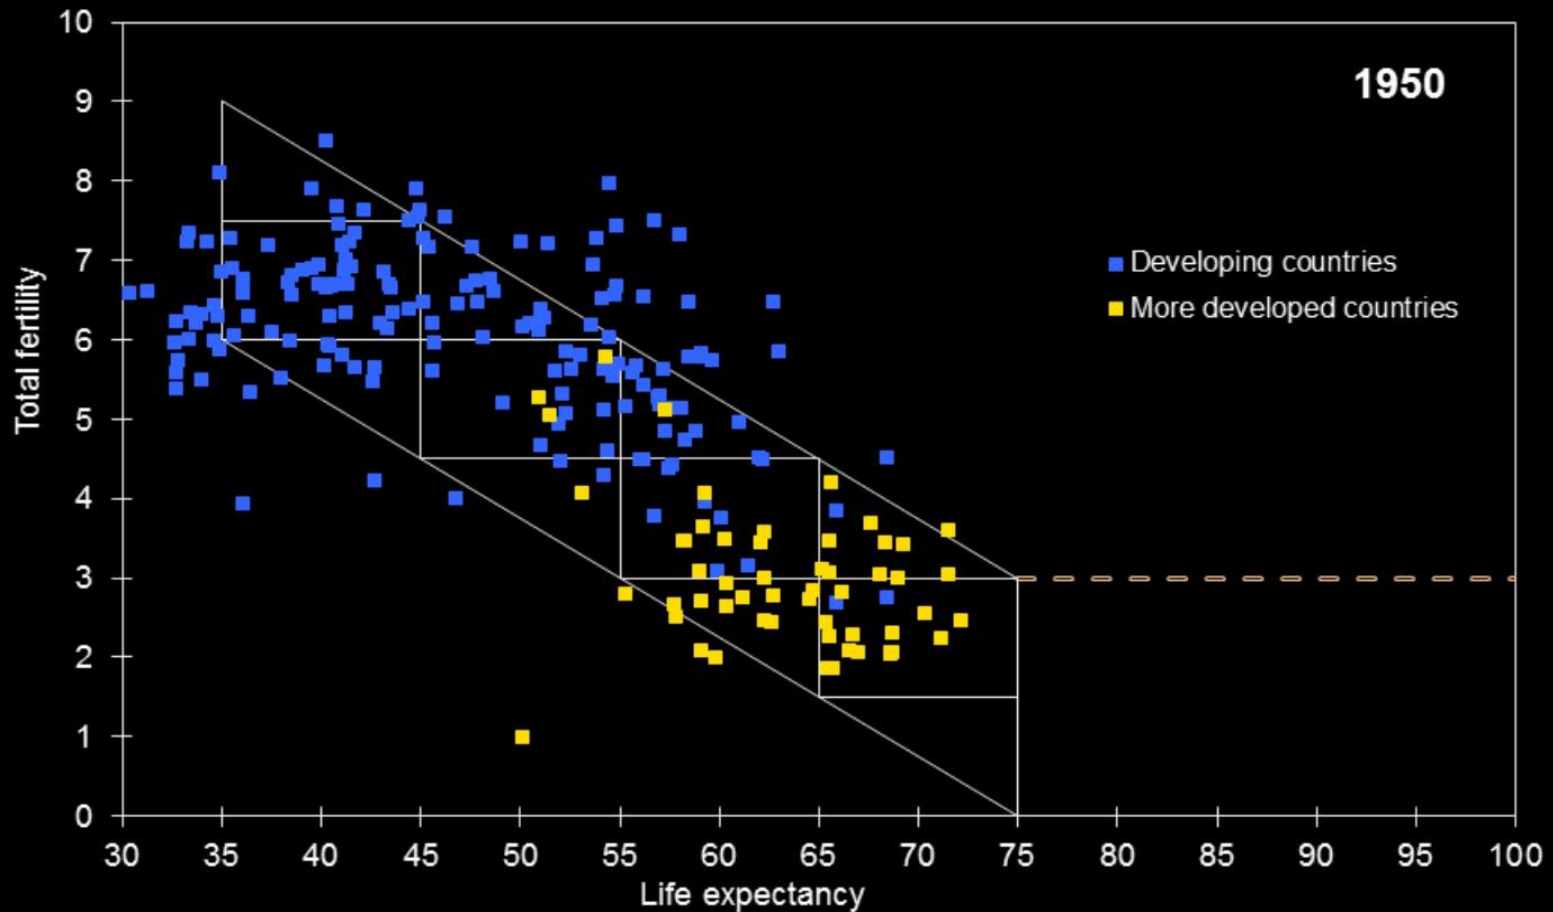

Demographic Transition: all together now!

The average person's travel through the demographic transition

Countries by position in demographic transition

Discussion (cont.)

- Both US/IPC and UN/WPP consider different types of movements in preparing assumptions for future migration:
 - Long-term or permanent migration
 - Labor or circular migration
 - Refugee movements
- Several countries assume no international migration for their population projections: India, Pakistan, Nepal, Viet Nam, forexample.

Discussion (cont.)

- If all countries are (potentially) involved, demographers feel the urge to balance migration at the world level:
 - The UN did this first for the projection period only, then moved slowly backwards to balance the past as well.
 - The US Census Bureau/IPC does not explicitly balance the world's migration, due the peculiarities of their production cycles.

Discussion (cont.)

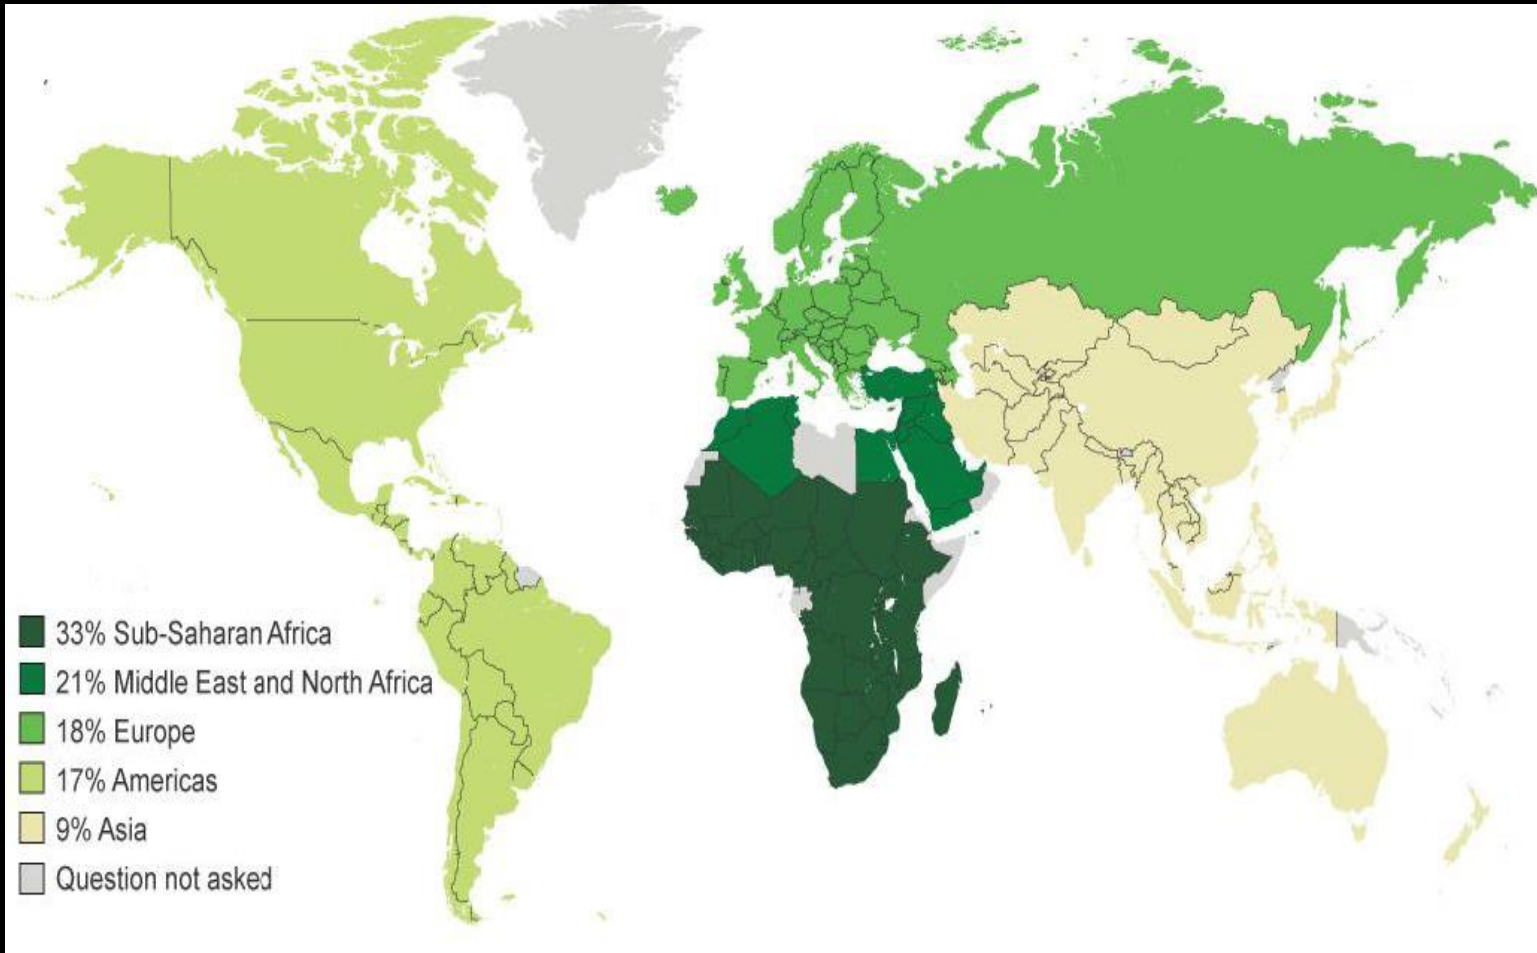

- Use of a scenario approach to capture possible and plausible future migration trends: telling stories.
- Use of conventional and non-conventional data for preparing migration assumptions/scenarios
- Use covariates?
- Use migration intentions?

Migration: Intentions to move

- About 630 Million adults globally (14% of world population) want to leave their country to permanently settle in another country*.
- One third lives in Africa

*Without labor migration

Potential migrants: countries of origin

Potential migrants: countries of destination

- USA
- Canada
- UK
- France
- Spain
- Australia
- Germany
